WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

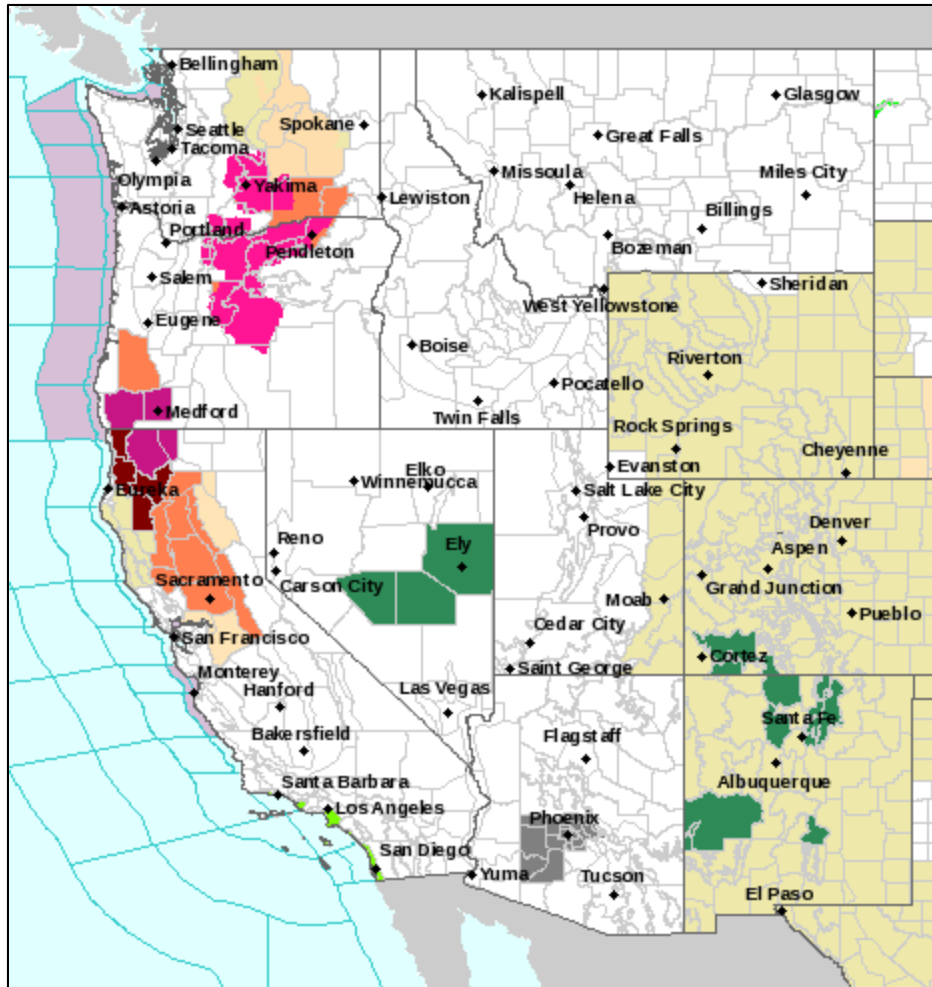

There is a little more resolution on the upcoming Monsoon Surge, although confidence amounts remain varied in terms of cloud to ground lightning coverage. A shortwave wave currently found over southern CA will progress northward during the next 2 to 3 days. It will have abundant monsoon moisture with it, especially in the upper levels. The main threat for lightning (isolated to widely separated-mixture of wet and dry) will be found across the NW Mtn and NE CA, specifically Siskiyou and northern Trinity counties this afternoon and overnight. Portions of the Northern Sierra also have a thunderstorm threat today favoring the Tahoe Basin, although storm movement would be very slow and contain more wetting cells. The shortwave will shift north and eastward on Saturday and allow for some drying although isolated to widely separated thunderstorms remain possible across NE CA and eastern portions of the NW Mtn. During this event period, others could experience lightning but the threat is very minimal and more high based showers are expected. Gusty outflow winds, potentially up to 50 mph, would accompany some of the thunderstorms. As a result of the above mentioned prediction, high risk due to lightning has been designated for portions of the Region.

Drier air will filter in Sunday into early next week and temperatures will remain 5 to 15 degrees above normal. The heat is not expected to abate during next week although another Monsoon moisture surge will be possible during the middle of next week. This surge looks to be brief like the near term one.

SOUTHERN CALIFORNIA

Temperatures today will be in the mid and upper 90s in the valleys to 110 in the low desert. Today into the weekend, a high pressure ridge is expected to become established over the central part of the state which should bring an end to the storms over Southern California. However, scattered wet storms will continue to be possible over the Sierras each afternoon. Light steering winds should keep the storms anchored to the higher elevations. Temperatures may warm to around 102 in the valleys due to less cloud cover Saturday and Sunday. Long range models show little change in the overall pattern with high pressure continuing to produce highs around 5 degrees above normal. Another surge of moisture may bring a renewed chance of thunderstorms over Southern California next Tuesday or Wednesday. Winds will be light, except near thunderstorms.
